### 5.11 Polar and Nonpolar Compounds, Polarity

Objective: SWBAT determine whether a bond is polar, nonpolar or ionic based on the electronegativity difference of the atoms, identify a molecule as polar or nonpolar based on it's bond polarity and symmetry

SPARK: what is electronegativity?

Polarity:

| EN Difference | Bond Character |
| :---: | :---: |
|  |  |
|  |  |
|  |  |

IONIC BONDS
-

## Non- Polar COVALENT BONDS

- 

## Polar COVALENT BONDS

Is HCl polar or non-polar?

## Self-Check:

Using your reference tables, determine the difference in electronegativity and use it to predict the polarity of the covalent bonds that form between each pair of atoms (ionic, very polar covalent, moderately polar covalent, non-polar covalent):
a) H and I
c) C and H
e) Li and O
b) O and O
d) C and O
f) C and F

BOND Character:

- Ionic character
- Covalent character

## Regents Question:

Which elements will form a bond with the most ionic character?
a) H and F
c) C and O
b) C and H
d) F and C

## PRACTICE: POLAR Bonds

Directions: For the following compounds: a) Draw the Lewis dot structure, b) Label each bond as polar (P) or non-polar (NP) c) For polar covalent bonds, draw a $\boldsymbol{\delta}^{-}$or $\boldsymbol{\delta}^{+}$on the atom for each bond. d) Label the shape that the molecule will have (use your notes from $5 \cdot 10$ ). See example below.

Example: $\mathrm{H}_{2} \mathrm{~S}$ - Since there are two atoms off the central atom and two lone pairs of electrons, the shape must be BENT!

1) HF
2) $\mathrm{H}_{2} \mathrm{O}$
3) $\mathrm{CO}_{2}$
4) $\mathrm{CHCl}_{3}$
5) $\mathrm{CH}_{4}$
6) $\mathrm{Br}_{2}$
7) $\mathrm{NH}_{3}$

- Molecules can be $\qquad$ even if bonds are $\qquad$ .
- Molecules need to be $\qquad$ for this to occur
- Ex. $\mathrm{CCl}_{4}$

- Non-symmetrical compounds will be $\qquad$ .
- Ex. $\mathrm{CHCl}_{3}$

- Dipole**
- Ex 2. $\mathrm{CFCl}_{3}$

- Molecular geometry will impact symmetry and thus polarity.
- Geometry of $\mathrm{H}_{2} \mathrm{O}$ vs. $\mathrm{CO}_{2}$
- Shapes that can be symmetrical
- Shapes that will never be symmetrical
- Ex. $\mathrm{NH}_{3}$

## Which can be symmetrical?

- Linear $=$ Sometimes
- Bent = Never
- Trigonal Planar = Sometimes
- Tetrahedral = Sometimes
- Trigonal Pyramidal = Never

1) Which diagram best represents a polar molecule?
1. 

2.
3.

HCl
2) As a bond between a hydrogen atom and a sulfur atom is formed, electrons are
a. shared to form an ionic bond
b. shared to form a covalent bond
c. transferred to form an ionic bond
d. transferred to form a covalent bond
3) The chemical bond between which two atoms is most polar?
a. $\mathrm{C}-\mathrm{N}$
b. $\mathrm{H}-\mathrm{H}$
c. $\mathrm{S}-\mathrm{Cl}$
d. $\mathrm{Si}-\mathrm{O}$
4) Which structural formula represents a linear nonpolar molecule containing two polar bonds? a.

3) Which electron-dot formula represents a polar molecule?
a.
c.
$\ddot{o ̈:: ":: \ddot{̣}}$
H:Ö:
d.

:c:
4) Which structural formula represents a nonpolar molecule?
a.
$\mathrm{H}-\mathrm{Cl}$
c. $\mathrm{H}-\mathrm{H}$
b.
H-O
d. $\stackrel{\mathrm{H}-\mathrm{N}-\mathrm{H}}{\mathrm{H}}$

Update glossary with the following words (use your notes and your book to help!):

1. Octet rule
2. Ions
3. Bond
4. Polyatomic ions
5. Ionic bond
6. Covalent bond
7. Double covalent bond
8. Triple covalent bond
9. Lewis electron-dot diagram
10. Molecules
11. Electronegativity
12. Polarity
13. Non-polar
14. Polar
15. Charge
16. Dipole
17. Criss-cross rule
18. Symmetrical molecule
19. Asymmetrical molecule
